

### *Scientific paper authorship ethics*

Researchers (paper authors) should ensure that only those individuals who meet authorship criteria (i.e. made a substantial contribution to the work) are rewarded with authorship and that deserving authors are not omitted;

All authors should agree to be listed and should approve the submitted and accepted versions of the publication. Any change to the author list should be approved by all authors including any who have been removed from the list;

All authors should have read and been familiar with the reported work and should ensure that publications follow the principles set out in these guidelines;

Authors should work with the editor or publisher to correct their work promptly if errors or omissions are discovered after publication;

Authors of material have a responsibility to inform the Publisher promptly if they become aware that the paper submitted, approved for publication or already published requires correcting;

Authors are not allowed to copy references from other publications if they have not read the cited work; authors should represent the work of others accurately in citations and quotations;

Relevant previous work and publications, both by other researchers and the authors' own, should be properly acknowledged and referenced. The primary literature should be cited where possible; replication of previous works and their paraphrasing are not allowed: they may be used only as a foundation for new conclusions;

Data, text, figures or ideas originated by other researchers should be properly acknowledged and should not be presented as if they were the authors' own. Original wording taken directly from publications by other researchers should appear in quotation marks with the appropriate citations;

Applicable copyright laws and conventions should be followed. Copyright material (e.g. tables, figures or extensive quotations) should be reproduced only with appropriate permission and acknowledgement.
